Pressestimmen "Dank dieser Komodie wei ich nun alles ber Sauerstoff und Luft - auch, warum der heilige Franziskus Gott fr ihre Erschaffung gedankt hat. Eine intelligente, handwerklich hervorragende und lehrreiche Arbeit!" Dario Fo, Literatur-Nobelpreistrger 1997 "Ein neues Glanzstck....Djerassi und Hoffmann haben ein fantastisches kleines Lehrstck geschaffen, das zwischen Gegenwart und Vergangenheit hin und her print und mehr zeigt ber die Vielschichtigkeit von Entdeckungen und ber menschliche Facetten und Prioritten, als mach seitenstarke Abhandlung oder Roman." Laborjournal, 2/2002 "Eine literarische, psychologische und wissenschaftliche Glanzleistung!" Oliver Sacks, Neurologe und Autor von "Awakenings: Zeit des Erwachens" "Endlich eine frische Brise! Intelligent und lehrreich." Dario Fo, Dramatiker und Literaturnobelpreistrger Rezension "In their play "Oxygen," chemists Djerassi and Hoffmann successfully employ ingenious dramatic devices to explore the multiple facets of the process of scientific discovery and to tell the fascinating stories of the men who made the "chemicl revolution" and of their wives as well." Murray Gell-Mann (Nobel laureate of Physics) "A play that burns more brightly than its subject: the complexity of the most human theme in science. What is the nature of greatness? And whom do we honor: the one who made it first, who published it first, or who understood it first? Three eminent men and three indispensable women--with their modern counterparts forced to judge. But Djerassi and Hoffmann teach us that only we can judge this question without an answer, but filled with probing insights into the nature of our lives, our loves, and our accomplishments." Stephen Jay (Evolutionary biologist, palaeontologist and best-selling author) The authors, two of the world's best chemists, have teamed up to take advantage of an impending, real historical event, the centenary of the Nobel Prizes, to create a fascinating, imaginary encounter in 1777 between three of the best chemists in history---the contenders for the discovery of oxygen---as they are considered more than two hundred years later for the first "Retro-Nobel." With a winning mixture of wit, scholarship, and stage craftsmanship, Carl Djerassi and Roald Hoffman show us how much scientists have learned about the world and how little they have changed, as the complex process of discovery is revealed as a genuinely human and social endeavor with timeless qualities. Harold Varmus (Nobel laureate of Medicine) This play is about scientists and science history, but also about the much broader question of the nature of discovery: is it finding a tree or seeing the forest? Jean-Marie Lehn (Nobel laureate of Chemistry) Rezension "In their play "Oxygen," chemists Djerassi and Hoffmann successfully employ ingenious dramatic devices to explore the multiple facets of the process of scientific discovery and to tell the fascinating stories of the men who made the "chemicl revolution" and of their wives as well."
